Automatic Software Update Service

Eliminate Security Vulnerabilities & Introduce New Functionality

AUTOMATIC

Running on a schedule that works for you, supported applications will automatically be upgraded to the most recent version. No action is required.

ELIMINATE SECURITY VULNERABILITIES

The latest versions of software products commonly contain patches that eliminate potential security vulnerabilities to lead to virus and malware infection.

FEWER INTERRUPTIONS

Get rid of most intrusive "An Upgrade is Available" boxes that interrupt work and confuse users.

GAIN NEW FUNCTIONALITY

The latest versions of software products commonly include new or enhanced features.

- Automatically keep over 90 software applications at their latest version.

- Eliminate security vulnerabilities that exist in software commonly found on most computers and servers.

- Gain new features from existing software as new versions are automatically installed.

Keeping software applications up to date on any computer or server is an important process. Most computers have common ancillary software applications such as Flash, Java and Adobe. Some computers have more recognizable applications such as iTunes or Skype. These applications are necessary for performing certain tasks, viewing documents, rendering websites and even enabling other programs to run.

While some applications do a fair job at notifying you when an update is available, keeping all of your important applications up to date can be a daunting task. Malicious software will often masquerade itself as a rogue application stating "An important update is available." Unable to discern between legitimate and nefarious software, computer users have become wary of such messages or ignore them altogether.

This potentially leaves applications running on computers that may have security vulnerabilities. A computer that is used to browse the Internet or check e-mail is especially vulnerable, even when equipped with anti-virus software.

Automatic Software Updates from WesTechs keeps over 90 applications at their current version. Updates are performed in the background and require no action from the person using the computer.
